Formulate a question

Generate a hypothesis

Formulate a question

- Should be specific (to allow formation of a hypothesis)
 - Must be answerable
 - Use what we know (previous work) and deductive reasoning
1. Every X has the characteristic Y.
 2. This thing in my hand is X.
 3. Therefore, this thing has the characteristic Y.

Generate a hypothesis

A **hypothesis** is a **tentative explanation** for an observed phenomenon

- Null hypothesis (what you seek to reject)
- Alternative hypothesis or hypotheses

Example questions and hypotheses

Question: Does fertilizer increase the amount of tomatoes produced by a plant?

Null Hypothesis: Adding nitrogen fertilizer does not change the number of tomatoes produced.

Alternative hypothesis: Adding nitrogen fertilizer increases the number of tomatoes produced.

Collecting data

- Observations
- Experiments

Types of variables

2 categories:

- **Dependent/Response variable (Y):** not controlled by the researcher—i.e., the answer!
- **Independent/Predictor variable (X):**
 - Factor: Controlled by the researcher
 - Covariate: Not controlled by the researcher

Testing hypotheses

- **Null hypothesis:**
 - What you hope to reject
 - No effect, no relationship amongst your variables
- **Alternative hypothesis:**
 - Everything not consistent with the null
 - Is there a difference between your groups?

Source: <https://xkcd.com/892/>

Testing hypotheses

You are not “proving” either hypothesis!

A hypothesis can be **refuted** (proven wrong, or **falsified**), but it *never can be proven to be true*.

Either:

Insufficient evidence to reject null hypothesis

OR

Evidence to reject null hypothesis, consistent with alternative hypothesis

Activity: Predation and camouflage

Replication

A single *datum* is inadequate to judge how reliably a characteristic has

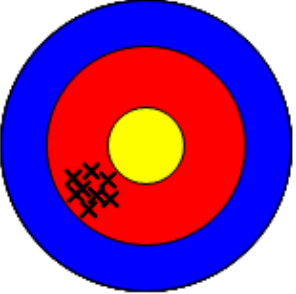

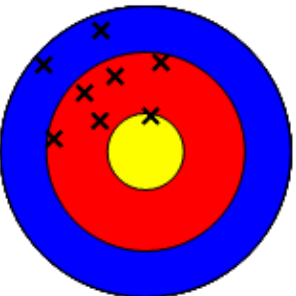

- Species-sample curves
- Performance curve
- Statistical power

Source: Booth et al 2014 Transactions of the American Fisheries Society

Accuracy and precision

- Bias
- Accuracy (difference from true value)
- Precision (standard error)
- Confidence intervals (probability)

	Accurate	Inaccurate (systematic error)
Precise		
Imprecise (reproducibility error)		

Source: <https://www.quora.com/What-is-accuracy-and-how-does-it-differ-from-precision>

Descriptive statistics

- Mean
- Median
- Mode
- Range

Mode = Mean = Median

SYMMETRIC

Mean ——— | ——— | ——— | ——— Mode

Median

SKEWED LEFT
(negatively)

Mode ——— | ——— | ——— | ——— Mean

Median

SKEWED RIGHT
(positively)

Hypothesis testing

A hypothesis is a statement about Θ (Greek letter theta), the population parameter of interest (usually the mean)

- **Null Hypothesis, H_0 :**
 - What you hope to reject
 - No effect, no relationship among your variables
- **Alternative Hypothesis, H_{alt} :**
 - Everything/anything not consistent with H_0
 - Basically, is there a difference between the groups?

Hypothesis testing

A hypothesis is a statement about Θ (Greek letter theta), the population parameter of interest (usually the mean)

- **Null Hypothesis, H_0 :**
 - What you hope to reject
 - No effect, no relationship among your variables
- **Alternative Hypothesis, H_{alt} :**
 - Everything/anything not consistent with H_0
 - Basically, is there a difference?

		Null hypothesis (H_0) is	
		True	False
Decision About Null Hypothesis (H_0)	Reject	Type I error (False Positive)	Correct inference (True Positive)
	Fail to reject	Correct inference (True Negative)	Type II error (False Negative)

Hypothesis testing

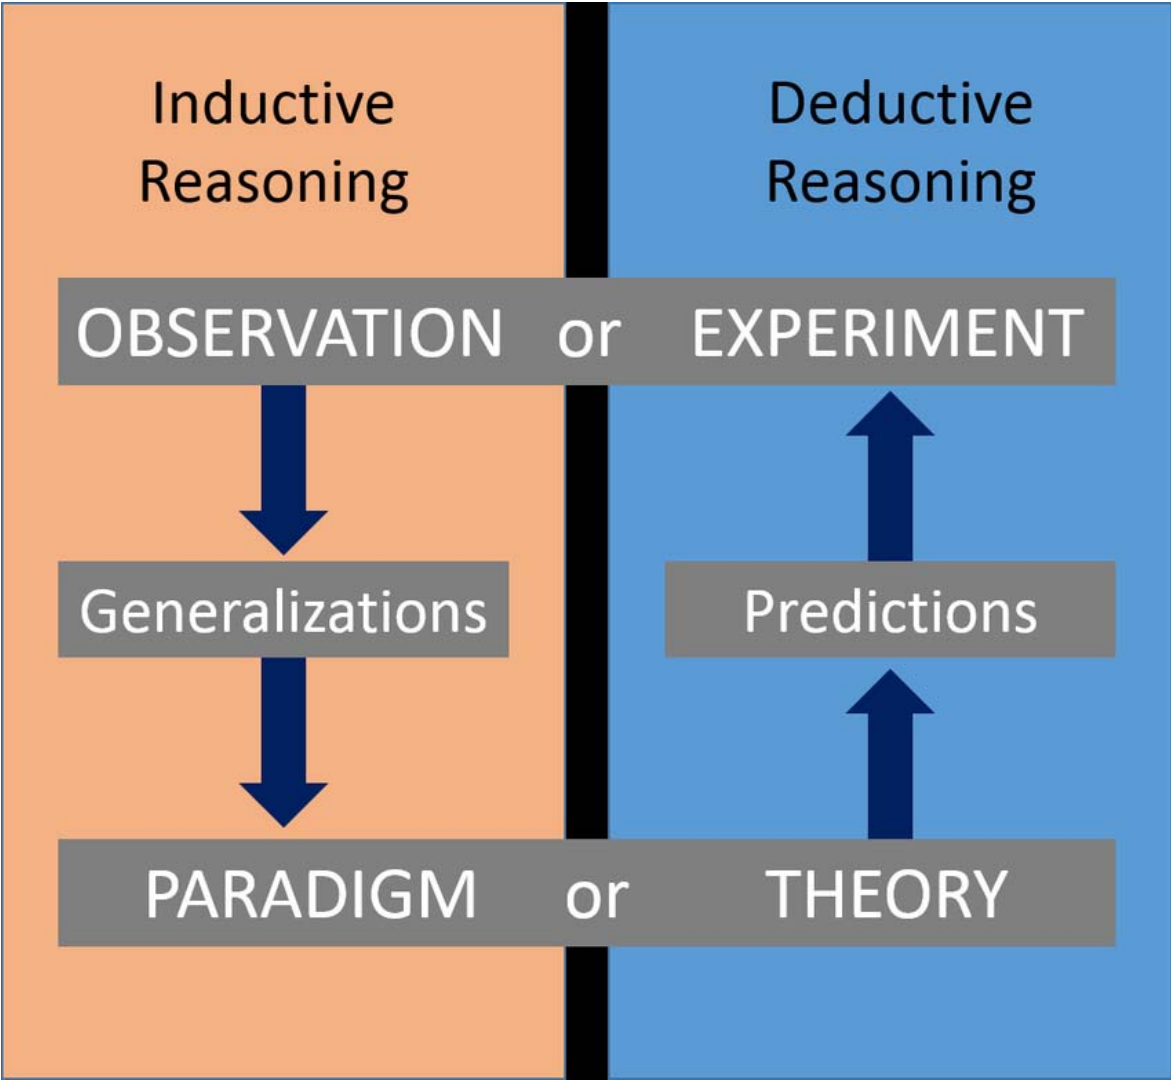

- **Test statistic:** difference between what was observed (the mean) and what is expected under H_0 – test statistic depends on the statistical test used (e.g., t , F , Z , X^2)
- **Null distribution:** used to determine what are the chances of having observed the calculated test statistic
- **p -value:** the probability of wrongly rejecting H_0

Report results and conclusions

- Did you reject the null hypothesis?
- If not, is there another question or approach that would answer your overarching question?
- How confident are you in your results?
